CSTUG, Mendel University, Brno, Czech Republic November 29th, 2014

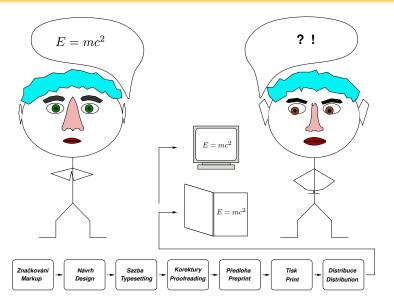

## Talk topics and take-home message

## The Past: Scholarly Communication going digital from paper

Summary

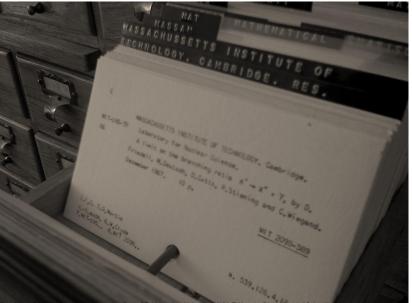

## Beginnings of scholarly communication: paper only

History

000000000000000

History

## 1931, Zentralblatt für Mathematik und ihre Grenzgebiete

- longest running abstracting and reviewing service in pure and applied mathematics
- still running, having almost 3,000,000 records of math literature published since 1868, most of them with independent peer review
- 7,000 reviewers, 120,000+ new records per year
- · commercial service (paid access now)

## 1940, January: volume 1, number 1 of Mathematical Reviews

- US competitor to Zentralblatt, also commercial, paid access
- monthly issues of peer reviews of the world's current mathematical literature
- 25fold increase since 1940: 400 ightarrow 10,000 reviews monthly
- MSC Mathematics Subject Classification developed and shared with ZMath: most papers MSC-classified as part of review (or since 1990 by author)

## 1958: Stanford Computer Science pioneer uses IBM 650

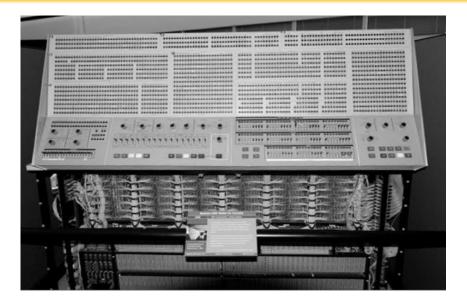

History

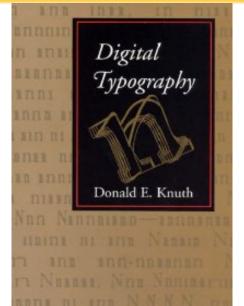

## 1967-69, Stanford Public Information REtrieval System: SPIRES

## 1969, SLAC: Stanford Linear Accelerator Center

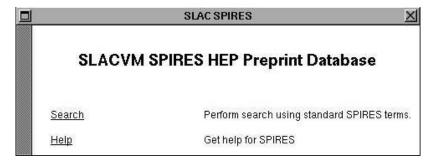

## 1977, Stanford, typesetting going digital, including math (TEX)

## 1989 @ CERN: hypertext to link the documents

## 1991, Stanford, SLAC: first web interface to DL catalogue

- first web site outside Europe
- first database on the web, "first web killer app" (T. Berners Lee)

## 1991, Los Alamos, preprint archive arXiv

An archive for electronic preprints of scientific papers in the fields of mathematics, physics, astronomy, computer science, quantitative biology, statistics, and quantitative finance which can be accessed online.

- · Paul Ginsparg: speed up of scholarly communication
- · submissions in TFX source: smooth switch to hypertext and PDF later
- now (2013) 7,000 submissions per month, almost 1,000,000 fulltexts in total
- hosted by Cornell library, costs (\$400,000 per year) shared by the community of users (institutions of users)

## 1997, Stanford, stanford.google.com, going global

The Future

## 1997, "bringing order to the web": Larry Page's ranking

- *global* citation analysis: "pages that are well cited from many places around the web are worth looking at"
- random walker/surfer metaphor (d = .85):

$$PR(A) = (1 - d) + d \times \left(\frac{PR(T_1)}{C(T_1)} + \dots + \frac{PR(T_n)}{C(T_n)}\right)$$

## 1998, CiteSeer: an automatic citation indexing system (for CS)

```
@inproceedings{Giles:1998:CAC:276675.276685,
 author = {Giles, C. Lee and Bollacker, Kurt D. and Lawrence
title = {CiteSeer: an automatic citation indexing system},
booktitle = {Proceedings of the third ACM
         conference on Digital libraries },
series = \{DL '98\},
year = \{1998\},
 isbn = \{0-89791-965-3\},
 location = {Pittsburgh, Pennsylvania, USA},
 pages = \{89 - -98\},
 url = \{http://doi.acm.org/10.1145/276675.276685\},
 doi = \{10.1145/276675.276685\},
 acmid = \{276685\},
publisher = \{ACM\},
 address = {New York, NY, USA}}
```

Automated parsing of paper full texts (from PostScript) using regular expressions; now: DBLP, CiteseerX, ACM-DL....

## 2000: History of the dream: vision of WDML

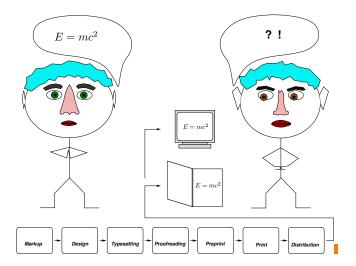

In the beginning was vision of all mathematical knowledge, *peer reviewed*, *verified* (100,000,000 pages) and engineered into one-stop e-shop/DL.

AMS supported NSF preparation grant (in 2003) for WDML—Worldwide digital mathematics library, planned to be funded by de Moore foundation (\$100,000,000 requested). Application was *not* successful.

Even other attempts on the European level (FP5, FP6) were not successful.

Publishers and local bodies started massive digitization themselves.

## The Present: Scholarly Communication via Digital Libraries

## Stakeholders in scholarly communication

- · authors: provably benefit from open access distribution optimization
- content mediators: publishers, digital libraries owners [non-]profit optimization
- readers: benefit from accessibility discoverability, search and presentation/understanding optimization

All benefit from digitization.

The Future

## 2005: The Czech Digital Mathematics Library

Project 1ET200190513 – funded by the Academy of Sciences of the Czech Republic. Programme "Information Society" (National Research Programme, 2005–2009), *full* (retro)digitization of 50,000 pages of mathematical literature per year, 8M CZK in total ( $\approx 1$ \$ per digitized page).

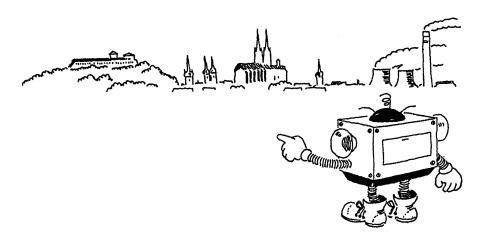

The goal: to investigate, develop and apply techniques, methods and tools that would allow the creation of a suitable infrastructure and conditions for establishing the Czech Digital Mathematics Library (DML-CZ). The library content: scholarly mathematical literature which has been published throughout history in the Czech lands.

<http://dml.cz>

## DML-CZ challenges: from pixels to minds

- Research part: 1) gradual enhancement of the digital material by 'knowledge enhancing' filters on markup-rich XML data. 2) New methods for (semantic) text processing tested on the available data.
  - **3)** The design of the work-flow aiming at mathematical knowledge stored in digital library.
- IPR part: sharing/delivery (economic models for knowledge sharing due to interests of content owners/publishers).

## Bottom up processing—local (Brno, CZ) document engineering

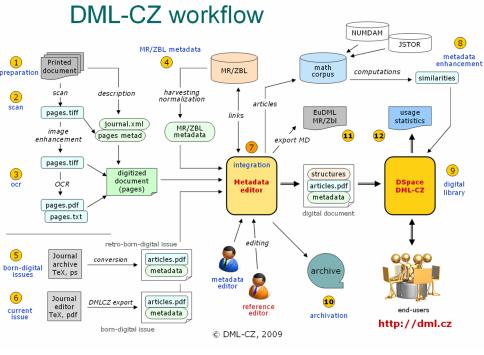

## DML-CZ: who?

### Four contractors (all from Czech Republic):

- ① *Czech Academy of Sciences, Prague* Jiří Rákosník, head of the project, responsibility for material selection, copyright negotiations.
- Masaryk University, Brno Petr Sojka (FI) formats and tools, technical coordination, information retrieval, indexing.

   Mirek Bartošek (Institute of Computer Science), content management system, metadata Q/A, long-term sustainability.
- ③ Charles University, Prague Jiří Veselý, Oldřich Ulrych, selection and preparation of materials for digitization, metadata cleanup.
- Library of Academy of Sciences, Prague Martin Lhoták, document scanning in Jenštejn.

## Some of the verified and proven technologies (in DML-CZ)

- Scanned image processing and transformations (with BookRestorer) (BP Pulkrábek)
- Mathematical optical character recognition: OCR by combining FineReader (SDK 8.1) and Infty by prof. Suzuki (DP Panák, Mudrák, BP Vystrčil)
- Pre-MSC era papers' automated classification by MSC (with Radim Řehůřek)
- gensim framework: similarity article computations aka document clustering (Ph.D. research by Radim Řehůřek)

## DML-CZ challenges and lessons learned

DML-CZ, the Czech Digital Mathematics Library, now serves more than 300,000 pages of more than 30,000 math papers. Challenges were

- migration of existing workflows (retro-digital, retro-digital and born-digital) into the repository
- · negotiations with Google Scholar towards better visibility
- semantic similarity metrics developments (Radim Řehůřek's Ph.D., now with Michal Růžička)

DML-CZ is according to The Ranking Web of World Repositories *the best* repository in CZ, 91. in EU and 203. in the world.

For more, see (who, what, browse, browse similar, how to search).

## Nature 454, 263 (2008) | doi:10.1038/454263b

## Starting small but adding up: a free maths archive

A small group of researchers is meeting in Birmingham, UK, later this month to plan a free digital library of mathematics.

All the mathematical literature ever published runs to more han 50 million pages, with around 75,000 articles added each year. Over the past decade there have been several attempts to make this prodigious body of work accessible in a single digital archive, but so far none has succeeded.

A group of mathematicians

intends to change this. They have started small, with a handful of digitization projects in Poland, Russia, Serbia and the Czech Republic. In a few years they hope to unite these repositories with their western European counterparts in an archive to be hosted by the European Union, according to the organizer, Petr Soika, an informatics scientist at Masaryk University in Brno in the Czech Republic. Eventually this pan-European archive could be expanded globally. he says.

To make such an archive easier to search, researchers have found ways to guess the subject of a paper on the basis of the frequency of symbols in it. But there will be many more-practical challenges, such as finding the funds to scan millions of old papers and striking deals with publishers who hold rights to them.

It may already be too late to build a single free mathematical archive, according to John Ewing, head of the American Mathematical Society. which maintains a list of more than

1.500 journals whose archives have already been digitized. "A few years ago, this model had the potential to change the mathematics journal literature in profound ways," he says. But most publishers have rushed to scan their own archives in order to lock them up and sell them to libraries

"While the effort to digitize the smaller collections is admirable. and it's certainly worthwhile, it's unlikely to effect a larger change," says Ewing.

About DML-CZ

DMI -C7 Home >

### Description

Mathematicians dream of a digital archive containing all peer-reviewed mathematical literature ever published, properly linked and validated/verified. The objectives of DML workshops were to formulate the strategy and goals of a global mathematical digital library and to summarize the current successes and failures of ongoing technologies and related projects.

#### Archive:

DML 2008: Proceedings of the 1st workshop, Birmingham, 2008
DML 2010: Proceedings of the 2nd workshop, Grand Bend, 2009
DML 2010: Proceedings of the 3rd workshop, Paris, 2010
Proceedings of the 4th workshop, Bertinoro, 2011

## Vision of European Digital Mathematics Library

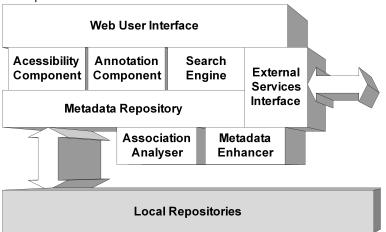

Finally three year project or *European Digital Mathematics Library, EuDML* (programme EU CIP-ICT-PSP, type Pilot B, EU contribution *(1.6 MEur, 50% of total budget only)* February 2010–January 2013. The strategy of

## The EUROPEAN DIGITAL MATHEMATICS LIBRARY Was:

- to master the technology, develop tools and offer them;
- concept of moving wall to motivate and engage commercial publishers without Open Access bussiness model;
- to collect data (from existing local or publisher's) digital libraries into 'one-stop shop' and achieve critical mass in the domain → 'a must/me too' effect then as with PubMed Central.

## EuDML as a virtual library portal

EuDML provides a virtual library based on data from smaller data providers, DLs and publishers:

## One portal: European Digital Mathematics Library

# Aggregation of data from building bricks of regional repositories:

14 data and technology providers plus associated partners as ZMath, Göttingen library....

DML content providers serve mostly publisher's or regional more or less established DML repositories: The Czech Digital Mathematics Library DML-CZ, NUMDAM, DML-PL, DML-PT, DML-GR, DML-BG, DML-ES,...

Aggregation via standard OAI-PMH protocol (OAI servers run by data providers).

<a href="http://eudml.org">http://eudml.org</a>

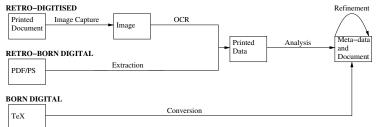

## DML processing challenges: document accessibility

Conversions (inversion of authoring+typesetting) needed from:

born-digital period: typesetting by TEX with export of [meta]data into digital library: maxTract otherwise on PDFBox (plain text)

retro-digital period: scanning, geometrical transformations (BookRestorer),
OCR (FineReader + InftyReader), otherwise on Tesseract
(no math)

retro-born-digital period: not complete .tex or .dvi data, bad formats, bitmap fonts of low resolution: finally Tesseract

The Future

## Getting fulltexts with math from bitmaps

Infty Reader from Fukuoka: working with prof. Suzuki to improve further (automation, support for Russian, LaTeX driver,...).

Automated only, no time (and money) to fix OCR errors.

Run in parallel in Brno, Grenoble and Lisbon to speed up. Almost 200K papers (more than 1M pages).

MathML output used for [internal] indexing and similarity computations only, not for metadata or export.

#### Getting fulltexts with math from PDF

#### Born-digital PDF: maxTract developments from Birmingham

```
\left(
\sum_{i=0}^{m} (m_i) (i_i = 0) a_{i} (i_i = 0)
\right)
                                               < math

                                                     <mo>=</mo>
                                                     <mn>0</mn>
                                                   </mrow>
       [p(x)q(x)]r(x) \\
                                                   <mi>mi>m</mi>
                                                 </munderover>
                                                 <msub>
                                                   <mi>a</mi>
                                                   <mi>i</mi>
                                                 </msub>
                                                 <msup>
                                                   <mi>x</mi>
                                                   <mi>i</mi>
open parenthesis
                                                 </msup>
                                                 <mo>)</mo>
sum from i = zero to m of
                                               a sub i x to the power of i
closing parenthesis
```

## Adding accessibility

Use of linear grammars by Anderson (1968)

On the Road

Adding accessibility to mathematical documents on multiple levels:

- access to content for print impaired users, such as those with visual impairments, dyslexia or dyspraxia
- output compatible with web browsers, screen readers and tools such as copy and paste, which is achieved by enriching the regular text with mathematical markup. The output can also be used directly, within the limits of the presentation MathML produced, as machine readable mathematical input to software systems such as Mathematica or Maple.

On EuDML 10k+ fulltexts are served, mostly for reading in Chrome (Chromevox plugin) and/or Adobe Acrobat Reader (as multiple-layer PDFs, [no tagged PDFs yet]).

# Content Similarity Results in EuDML: <a href="http://eudml.org">http://eudml.org</a>

We have developed and delivered technology for *similarity* (gensim). document conversions (to Braille or to text: Mathml2text) and math content normalization. Different formulae representations for similarity computation.

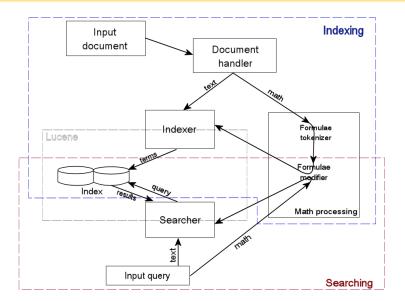

#### Math aware Search and Indexing

- · Usual way of seeking information via [Google] search
- · Conventional searching approaches are not applicable for math
- Usage of existing mathematical search engines (MathDex, EgoMath, LATEXSearch, LeActiveMath, MathWebSearch) problematic
- · new Math Indexer and Searcher (MIaS) developed at MU

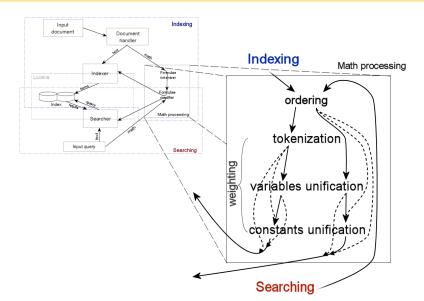

#### Math Indexer and Searcher — Features

- · Inspired mostly by MathDex and EgoMath
- · Based on full text core Apache Lucene
- · Presentation MathML
- Allows similarity (not only exact match) between query and matched term
  - Commutativity
  - · Unification of variables and constants
  - · Subformulae matching
- Level of similarity calculation for expressions
- · Mixed mathematical-textual gueries

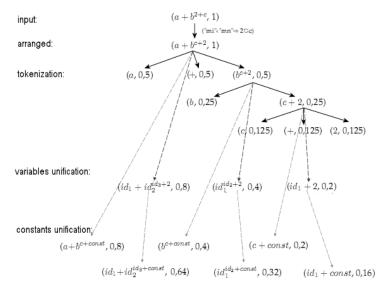

## Math Indexer and Searcher — Design

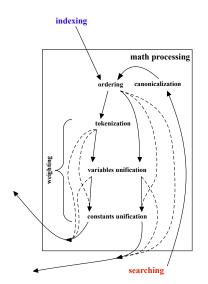

## Math Indexer and Searcher — Design II

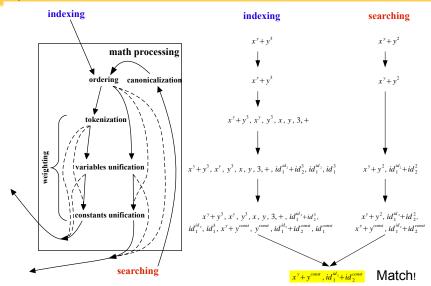

# Formula Processing Weighting Example

## Math formulae indexing processing

#### Example

#### Implementation

- Java
- · Solr + Lucene
- scalable (10<sup>9</sup> formulae indexed from arXiv)
- · jTidy for text extraction
- Mathematical part implements Lucene's interface Tokenizer able to integrate to any Solr/Lucene based system as DSpace, many web pages...

#### Search demonstration

#### Finite Precision Measurement Nullifies Euclid's Postulates

... and the unit circle  $x^2 + y^2 = 1$  are both dense but they do not intersect, in contradiction to Euclid's postulates ... score = 3.2980976

arxiv.org/abs/quant-ph/0310035 - cached XHTML

#### COMMENT ON RECENT TUNNELING MEASUREMENTS ON Bi22Sr22CaCu22O88

... gap, (b) s-wave gap, and (c) s<sub>x2+y2</sub> gap.

#### Formulae search demonstration comments

Demo web interface: https://mir.fi.muni.cz/webmias-ntcir/

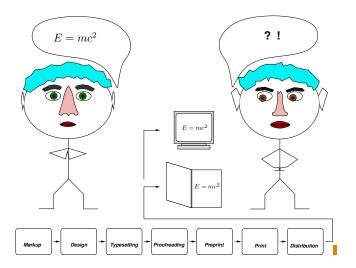

- MathML/T<sub>E</sub>X input (LaTeXML or Tralics [2] for conversion to MathML [9])
- Canonicalization of the query problems with UMCL library [1]
- · Matched document snippet generation
- · MathJax for nicer math rendering and better portability
- · Snuggle TeX for on-the-fly as-you-type rendering

All up and ready on the EuDML system: <a href="http://eudml.org/search/">http://eudml.org/search/>

#### Open Access in DMLs

- controversial issue, huge misunderstandings, domain specific (PubMed Central example)
- publication quality is orthogonal to openess: PLOS example
- example of Impact factor boost
- serial crisis: Elsevier's margin 40% (e.g. billions of \$s)
- library bundles, consortia
- controlled profit in OA vs. uncontrolled profit in commercial closed access?
- · moving wall policy towards open access to DL heritage
- · is Open Access future of DMLs?

# The Future: Scholarly Communication via DMLs using rich KB

The Future

## Towards higher level content representations – knowledge bases

#### NLP processing from strings via words to meaning

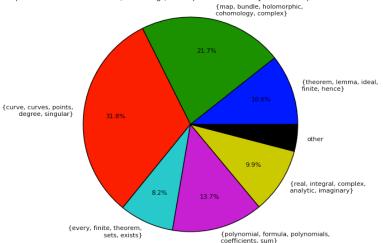

- to allow searching (semantically) similar papers, precise [semantic] indexing: formulae representation and indexing
- to allow exploration of a DML by intelligent browsing of (semantically) similar papers: distributional semantics topic modeling as Latent Semantic Indexing, Latent Dirichlet Allocation
- to allow personalization and domain specifics, e.g. semantic faceted search (formulae,...)
- to track 'train of thought' narrative qualities of papers
- finally have "knowledge at your fingertips"

## Example I: Automated Meaning Picking from Texts

#### LDA Topics Pie Chart for math.0406240:

Each slice represents a different topic. The size of the slice corresponds to "how much is the article about this topic?". Topics which contribute <6% to the above document are aggregated under "other".

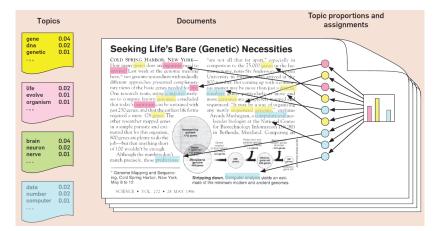

LDA topics are distributions over words; in the image, each topic is summarized by its five most probable words.

#### Probabilistic Topical Modeling: Latent Dirichlet Allocation

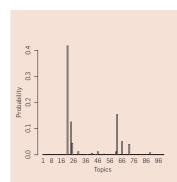

topic: weighted list of words

· document: weighted list of topics

## Topical Modeling: Latent Dirichlet Allocation II

· all topics computed automatically from document corpora

```

#### Future of DMLs?

- full text mining in semantic direction (typesetting<sup>-1</sup>), higher level NLP
- open access in the long term, author's direct publishing (arXiv, Perelman), peer review later?
- increase of automation and precision on [multiple] ways from author's head to the reader's one–LOD
- · globalization (Google Scholar), GDML, automated suggestions
- personalization (up to the individual's preferences)
- · new type of libraries (LOD style)?

## Future challenges

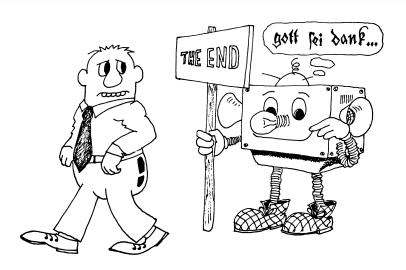

- · robust Math OCR is necessary
- robust born-digital PDF2Math conversion is needed as well
- only then challenges as: multilingual math retrieval, MathML indexing and search, math common sense, text and math disambiguation and understanding, mathematical document classification, document similarity could be possible
- · arXiv.org fulltext indexing
- T<sub>E</sub>X based open source journal processing system
- T<sub>E</sub>X as a fix point of
