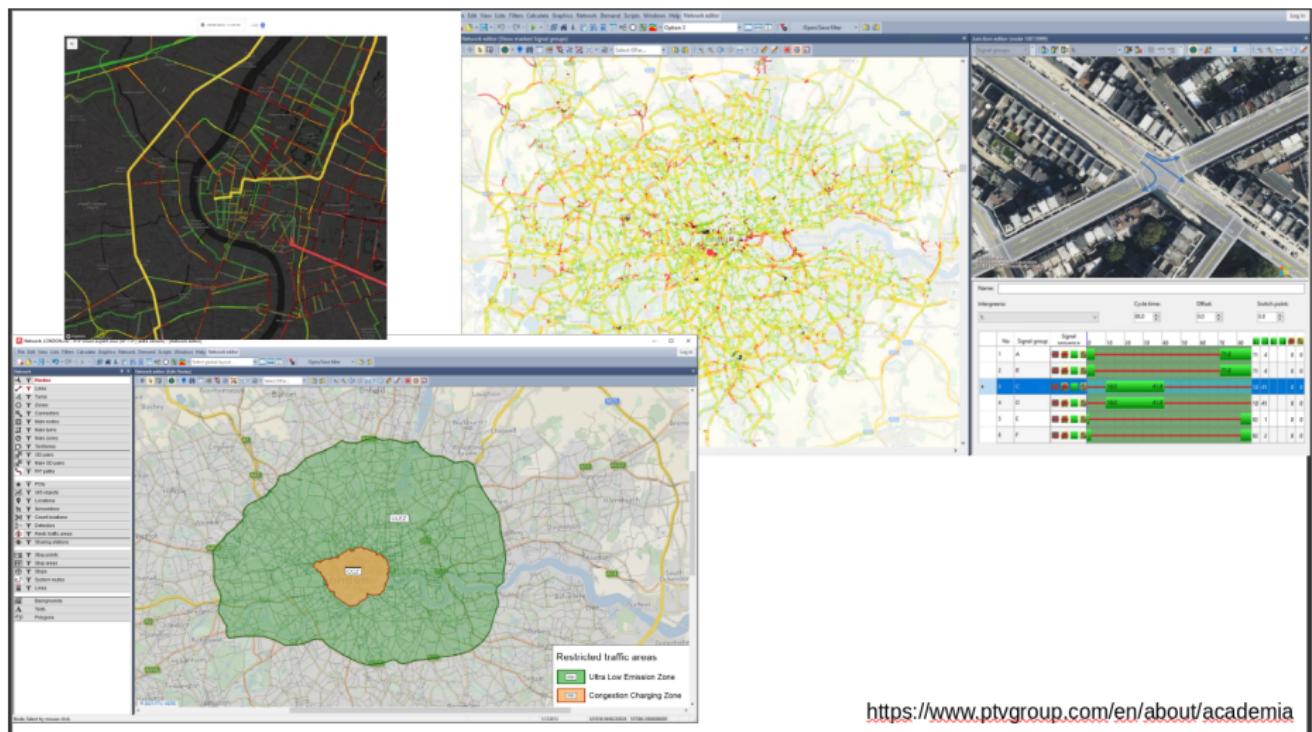

Fig. 3. Examples of the optimal passenger ordering. Note: There are other permutations that would give identical results. Seating would proceed following the patterns illustrated. The shading only indicates the passengers who would be inside the plane at the same time.

Neural Cellular Automata-based Land Use Changes Simulation

Jinian Zhang, Lanfa Liu

Matematické modelování:

Weak coupling of neurons enables very high-frequency and ultra-fast oscillations through the interplay of synchronized phase shifts

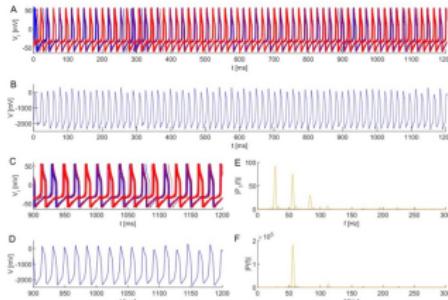

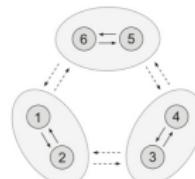

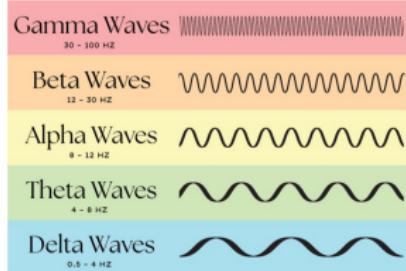

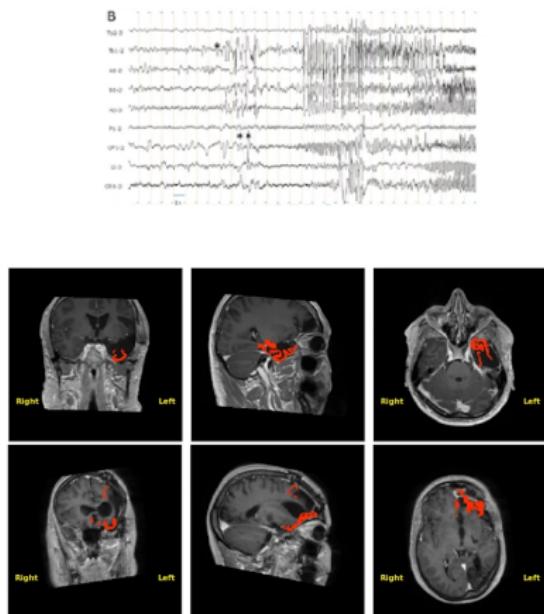

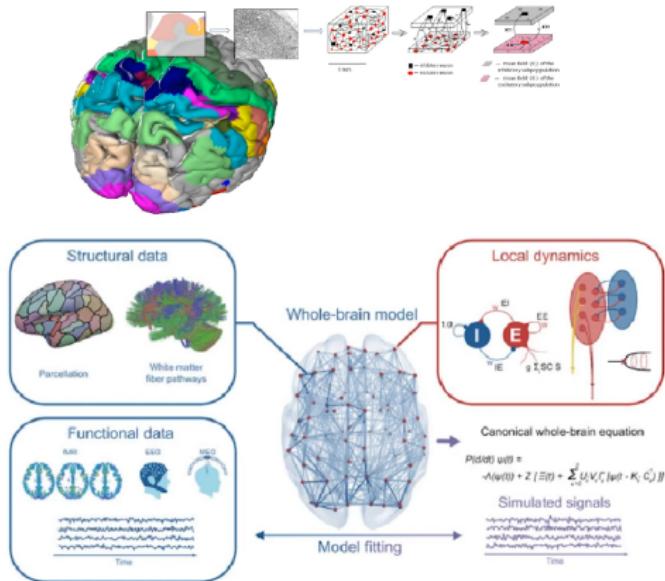

Figure 5. (A) Collective APs of two subpopulations in a neuronal network model (Equation 15) composed of 50 all-to-all coupled Morris-Lecar neurons with heterogeneous membrane capacitances $C_m = TN(0.90, 0.05^2, 0.75, 1.05)$ and random initial conditions in Equation 1. This setting leads to a doubled dominant frequency in (B) the composed signal $V = \sum_{i=1}^{50} V_i$. Zooming in on the dynamics of (C) all neurons, (D) composed signal, and the corresponding periodograms of (E) individual neurons and (F) the composed signal. The robustness of the anti-phase behavior is demonstrated by a noisy applied current $I_{ext} \sim N(43, 1^2)$ at each simulation step $\Delta t = 0.01$. The remaining parameter values are identical (see Table 1), $e = 0.002$.

Boolean network model predicts cell cycle sequence of fission yeast

Maria I. Davidich and Stefan Bornholdt

Institute for Theoretical Physics, University of Bremen, D-28359 Bremen, Germany

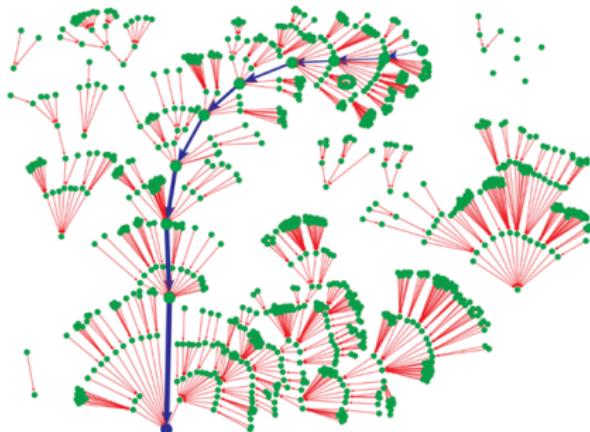

FIG. 2: State space of the 1024 possible network states (green circles) and their dynamical trajectories, all converging towards fixed point attractors. Each circle corresponds to one specific network state with each of the ten proteins being in one specific activation state (active/inactive). The largest attractor tree corresponds to all network states flowing to the G1 fixed point (blue node). Arrows between the network states indicate the direction of the dynamical flow from one network state to its subsequent state. The fission yeast cell-cycle sequence is shown with blue arrows.

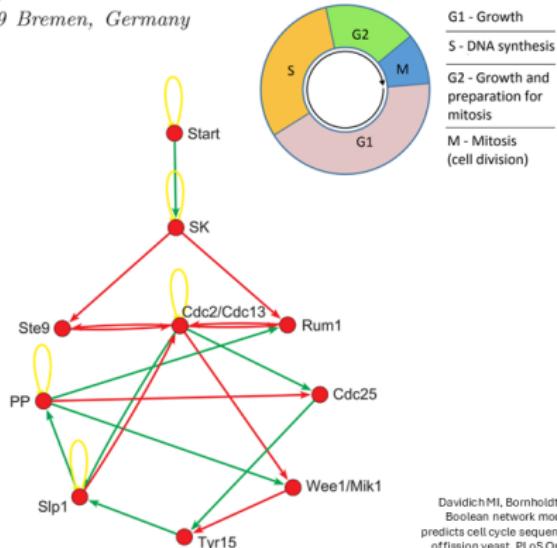

FIG. 3: Network model of the fission yeast cell-cycle regulation.
